

Web & Mobile Application Development

Project Proposal Submission

Project Description

'Jaatra' is a cross-platform travel companion application inspired by TripAdvisor, designed to help users discover, review, and plan visits to hotels, restaurants, and tourist attractions. Built with React (web) and React Native (mobile), the app delivers a seamless experience across both platforms -allowing travelers to explore destinations, read community-driven reviews, and build personalized wishlists, all from a single shared backend.

Main Features

- **Place Discovery & Search:** Browse hotels, restaurants, and tourist attractions by location, category, or keyword with smart filtering by rating, price range, and type.
- **Reviews & Ratings:** Authenticated users can post, edit, and delete reviews with star ratings and photo uploads. Others can mark reviews as helpful or flag them.
- **User Profiles & Wishlists:** Personalized profiles with travel history, saved places (wishlists), and a summary of review activity.
- **Interactive Maps:** Map view to explore nearby places, visualize clusters of attractions, and get directions for any listed destination.
- **Cross-Platform (Web + Mobile):** Shared API layer with React on web and React Native on mobile, ensuring consistent features and UX across all devices.
- **Admin Dashboard:** Web-based admin panel to manage listings, moderate reviews, and handle reported content.

Tech Stack (we may change them later based on our progress and course contents)

Frontend (Web)	React.js
Frontend (Mobile)	React Native
Backend	Node.js + Express
Database	PostgreSQL (Supabase)
Auth	Supabase Auth
Storage	Supabase Storage
